### *Venus in Hydra*

Venus is the shiny planet that probably inspired the fall of the archangel of pride. The Hydra constellation lies comparatively low in the sky. The legendary monster had many names and one of them was Tiamat. Hydra is a very long constellation perhaps faint but stretching below Cancer, Leo and Virgo while carrying three “assistant” constellations on its back, namely Sextans, Crater and Corvus. All mentioned constellations are zodiacal.

### *The Zodiac*

The zodiacal position is the real position of a planet in the observed sky. There is a real sky right above us as opposed to fancy and superstition and it is there for us to witness as well as discover. Thus when planets enter their appropriate constellations they are always zodiacal. Everybody knows that Mars in Pisces is a zodiacal position but Mars in Cetus is also a zodiacal position and so is Venus in Hydra. There are 24 IAU constellations that can be called zodiacal on account of the planets there. Ophiuchus is obviously zodiacal since everybody knows that the Sun enters the large constellation of Ophiuchus every year after spending only a short week in Scorpius.

The zodiac is a fascinating study. In the year 2007 we shall discover Jupiter in Ophiuchus along with Mars, Venus, Mercury, the Sun and the Moon. Venus will enter Sextans, which is not so rare after all, and afterwards it will go into Hydra, which is an exceptional portent. In summer 2006 we based all our political predictions on the relatively rare entry of Venus in Orion. In the year 2005 our pope left us with Venus in Cetus. It is thus appropriate to determine special events as marked by exceptional planetary positions. There is a whole new world open to exploration when one assumes the real positions of the planet as valid against the fictitious. The rational is that if NASA is able to launch a spacecraft, it must be able to calculate the position of the Moon. Thus when the Moon is in Auriga such as today, Friday, September 15, 2006, you can stay assured it is *there* albeit some so-called “astrological” program tells you it is somewhere else. One should not bother much with such programs since they are not even able to tell you your own natal Sun position apart from other major disadvantages and more of less obvious collection of evident nonsense.
